

WITTENSTEIN

Facelift means higher technical specifications

- Increased acceleration torque
- Increased max radial force
- Reduced operational noise
- Additional option on reduction

Celebrating 25 years of the alpha brand and for our products birthday, we are giving the market higher technical specs for our alpha SP+ and alpha TP+ ranges.

Starting in July 2009, the [alpha SP+](#) and [alpha TP+](#) will have a slightly new look and, most importantly, higher technical specifications.

These two gearboxes have received a facelift which will make them astatically look slightly different; however, this change which will not impact on critical external and connecting dimensions.

All customers ordering these two series during summer 2009 will receive the new series.

The upgraded models are a renewed demonstration of WITTENSTEIN alpha's undisputed excellence in the field of mechatronics. The torques of the new look are significantly higher - up to 25%, depending on the version - raising the power density of what are in any case incredibly compact gearboxes. Users can benefit from this extra torque by "downsizing", that is to say they can select a smaller more cost effective gearhead without compromising on specifications.

The optimal gearhead design can be determined with the help of WITTENSTEIN alpha's new cymex®3 sizing tool, which additionally features an integrated calculator for energy consumption. Efficient utilisation of energy is guaranteed from the outset.
